

SYSTEM ARCHITECTURE FOR
BUSINESS PROCESSES DEVELOPMENT AND EXECUTION

ABSTRACT OF THE DISCLOSURE

5 A system for designing a business process includes
an introspection module that transforms implementation-
specific components into generic components. The
implementation-specific components are associated with a
number of implementations. A component manager defines
10 the generic components. A process designer selects at
least one of the generic components from the component
manager, and generates a business process that uses the
at least one of the generic components.
